Chapter 3

The coding of identifiability in Mooré

Amos Teo
University of Oregon

This paper looks at the morpheme /-wã/ ~ /-ã/ in Mooré (Gur, Burkina Faso), which previous analyses (e.g. Peterson 1971; Canu 1974; 1976; Nikièma 1989) call a “definite” marker. The paper aims to show that an analysis of /-wã/ ~ /-ã/ needs to consider how NPs are marked for the semantic and/or discourse-pragmatic function of referentiality and/or identifiability. By drawing on both elicited and textual data, the analysis shows that, in addition to marking identifiability, /-wã/ ~ /-ã/ is often used to mark contrastive focus. Furthermore, in some cases, /-ã/ (without nasality) can still be used to mark an NP as both referential and identifiable to both the speaker and listener, but this depends on the phonological shape of the NP. The patterns suggest that one can analyze the marker /-ã/ as two morphemes: /-a/; and a separate nasal morpheme, with the later having the potential to also mark contrastive focus. However, this analysis is complicated by the phonological form of the NP.

1 Introduction

Mooré (ISO: mos), also known as Mossi, is a Gur language within the larger Niger-Congo family. It is one of the main languages of Burkina Faso, with an estimated 5 million speakers in the country (Lewis, Simons & Fennig 2013). Estimates also give around 60,000 speakers living in neighboring countries, including Côte d’Ivoire, Benin, Togo and Senegal.

Previous descriptions of Mooré (e.g. Peterson 1971; Canu 1974; 1976; Nikièma 1989) point to the existence of a “definite” morpheme /wã/ that follows the noun phrase (NP) it modifies, along with its phonologically determined allomorph /-ã/. The latter is described as occurring after nasal consonants or when replacing the vowel in a suffix that begins with a consonant (i.e. the consonant is part of the suffix). In most analyses, the treatment of /-wã/ as a “definite” marker appears to be motivated by its translation into English as ‘the’ or French ‘le’ / ‘la’ / ‘les’. These analyses are problematic, given that the term definite (or définisseur) is not clearly defined in the descriptions cited above, along either structural or functional lines, nor are examples of /-wã/ ~ /-ã/ from actual discourse given in those descriptions.

This paper therefore aims to show that an analysis of /-wã/ ~ /-ã/ needs to consider how NPs are marked for the semantic / pragmatic notions of identifiability in Mooré;
I will reserve the term *definite* to describe a structural or formal category (e.g. as per Du Bois 1980). By drawing on both elicited and textual data, the analysis will show that /-wã/ ~ /-ã/ is often used to mark contrastive focus in addition to identifiability, while /-a/, without nasality, can be used to mark an NP as identifiable to both the speaker and listener, at least in the speaker's judgment of the listener's state of mind. This suggests that one can analyze the form /-ã/ as consisting of two morphemes: /-a/; and a separate nasal morpheme, with the latter used to mark contrastive focus. However, this analysis is complicated by the phonological form of a lexical noun with its citation noun class suffix, specifically the vowel of the noun class suffix.

To illustrate the problem, consider the following elicited examples:

(1) màm nɛ̀ bōōbá.¹
màm nɛ̀ bōō-gá
1sg.subj see-aff goat-cl12
'I see a goat.' (AT_20140605)²

(2) màm nɛ̀ bōōbá.
màm nɛ̀ bōō-g-ã
1sg.subj see-aff goat-cl12-ã
'I see the goat.' (that we talked about); or 'I see the goat.' (as opposed to seeing something else); or 'I see the goat.' (as opposed to not seeing the elephant) (AT_20140605)

(3) màm nɛ̀ wōbò.
màm nɛ̀ wōb-gò
1sg.subj see-aff elephant-cl15
'I see an elephant.' (AT_20140605)

(4) màn nɛ̀ wōbá.
màn nɛ̀ wōb-g-ã
1sg.subj see-aff elephant-cl15-ã
'I see the elephant (that we talked about).' (AT_20140605)

(5) màn nɛ̀ wōbá.
màn nɛ̀ wōb-g-ã
1sg.subj see-aff elephant-cl15-ã'
'I see the elephant.' (as opposed to seeing something else); or 'I see the elephant.' (as opposed to not seeing the elephant) (AT_20140605)

¹ The 1st line of the examples gives a phonetic transcription of the data, while the 2nd line gives the proposed phonemic form with morpheme boundaries. Both lines are provided since some of the proposed phonemic forms differ slightly from the phonetic forms. Furthermore, if there are any errors or disagreements, future researchers can see if an error lies in the phonetic transcription or in the phonological analysis.

² The source for each example is given in parentheses with the name of the file. More discussion is still needed with regards to giving access to the recorded data.
In (1)–(2), we can see a two-way distinction between the absence vs. presence of /-ã/, which corresponds to the use of the indefinite or definite article in the English translation. However, in (3)–(5) we find a three-way distinction between no marker, /-a/ and /-ã/. Here, the nasal form is not clearly required for a definite reading of the NP. It will be later shown that in discourse the lack of nasality in an example like (1) does not necessarily correspond to a non-identifiable (or indefinite) reading.

The paper is organized as follows: in §2, I define the semantic / pragmatic notion of identifiability, and its relation to the structural category of definiteness. In §3, I briefly look at some previous descriptions of “definiteness” in Mooré. In §4, I give a brief description of NP morphology. In §5, I look at the expression of non-identifiable NPs in Mooré; while in §6, I consider the expression of identifiable NPs. In §7, I consider some of the complications in analyzing how identifiability and focus are coded in Mooré. Finally, in §8, I summarize the analysis presented in this paper and propose further avenues for research.

The data for this study come from Timbwaoga Aimé Judicaël Ouermi, a male Mooré speaker in his early 20s from Ouagadougou, Burkina Faso. It is acknowledged that future research will require the participation of more speakers of the language. The data were recorded at the University of Oregon, Eugene, over a 9 month period between 2013 and 2014.

2 Identifiability and Definiteness

An important distinction to make is between the formal categories of DEFINITE / INDEFINITE and the semantic / pragmatic categories of REFERENTIALITY and IDENTIFIABILITY. According to Du Bois (1980: 280), “[a] noun phrase is referential when it is used to speak about an object as an object, with continuous identity over time”. The “object” in question could be physical or conceptual; specifically known or unknown; a single entity or multiple ones; and it may exist in the real world or in a hypothetical world, or “universe of discourse” as per Givón (2001: 388)’s use of this term. A referential NP can function to either: (a) activate a “mental file” for a particular object; or (b) refer back to a “previously opened mental file”. This is in contrast to non-referential NPs, which are not sensitive to any previous mentions in a discourse, nor are they sensitive to any semantic distinction between singular and plural (at least in English; Du Bois 1980: 210). Non-referential Ns/NPs can appear: (a) as the modifier element in a compound; (b) in predicating expressions (denoting proper inclusion in a category); and (c) as what Du Bois refers to as “conflated objects”, where the object is non-individuated and “conflated” with the verb (similar to noun incorporation).

Once an NP is interpreted as referential, it can be interpreted as identifiable or non-identifiable. According to Du Bois (1980: 232), “[i]dentification ordinarily involves singling out the particular referent intended by the speaker”. Du Bois (1980: 233) goes on to propose a “curiosity principle” that states, “A reference is counted as identifiable if it identifies an object close enough to satisfy the curiosity of the hearer” – though it may be more precise to think of this as what the speaker believes is close enough to satisfy the
curiosity of the hearer. The level of satisfaction seems to be based on the Gricean maxims of quantity and relevance – it is more common for people in everyday communication to only partially identify referents than to specify every single characteristic that would identify a referent as a unique entity.

The term *definite* is often used to describe a referent that can be identified by the listener (as in Comrie 1989: 65), or to describe a nominal expression denoting a referent that is presumed by the speaker to be identifiable by the listener (as in Lambrecht 1994: 79). The reasons for following the latter option of using the term *definite* to name a formal category (i.e. for particular forms), separate from the semantic or pragmatic concept of identifiability, are clear if we consider the use of the definite article *the* in English. Typically, *the* marks NPs that point to objects that are both referential and identifiable, as in (6). However, there are contexts in which *the* can also mark a non-referential (and generic) NP, as in (7):

(6) I saw a small elephant get attacked by a lion. The elephant got pretty angry.

(7) The elephant is the largest land animal on earth.

Similarly, the indefinite article *a / an* in English can mark a referential non-identifiable NP, as in (8), or a non-referential (and hence by default, non-identifiable) NP, as in (9).

(8) I’m looking for a black jacket. I think I left it here this morning.

(9) I’m looking for a black jacket. Do you sell any in your store?

Consequently, it is useful to reserve the terms *definite* and *indefinite* for structural / formal categories in a language, and to see how they align with the semantic / pragmatic functions of marking referentiality and / or identifiability, and perhaps even contrastive focus. As Lambrecht (1994: 79) notes, the categories of formal definite marking and identifiable information status do not always align perfectly. We shall see that this is also the case for Mooré.

### 3 Previous descriptions of definiteness in Mooré

Most descriptions of Mooré include a brief account of a “definite” marker /wã/. Peterson (1971: 77) states that what he calls the “definitizer” has the form /wã/, which goes at the end of relative clauses and also on nouns, as in:

(10) Example as given in Peterson (1971: 77):
    
    kí wã [kí w̥ã ]
    
    ‘the millet’

However, according to Peterson, if the marker follows an elided vowel (or a nasal consonant), the /w/ is deleted and the vowel merges with the word, as in the following examples:
The coding of identifiability in Mooré

(11) Examples as given in Peterson (1971: 77):

bôãngá  bôãngá [bwângã]  bëngré bëngrá [bëngârã]
'donkey’ ‘the donkey’ ‘bean’ ‘the bean’

Canu (1974: 179) similarly posits the underlying form of the définitisseur ‘definitizer’ as /uãˉ /, which “dans le discours rapide et l’élocution relâchée … s’amalgame avec la dernière voyelle du nominal” (“in fast or relaxed speech ... merges with the final vowel of the noun”), as in:

(12) Examples as given in Canu (1974: 179):

bá:gá uã̄ → /bá:gã́ / [bá:ɣã́]
‘le chien’ (‘the dog’)

uōbgò uã̄ → /uōbgã̀ / [wōbɣã̀]
‘l’éléphant’ (‘the elephant’)

zóm uã̄ → /zómã̄ / [zómã̄]
‘la farine’ (‘the flour’)

Similarly, Nikièma (1989: 96) notes that: “[l]a marque du défini wã est réduite à à après un mot terminé par une consonne” (“the definite marker wã is reduced to à after a word ending in a consonant”); but he does not elaborate further.

Interestingly, in none of these sources is there any mention of the definitizer having the form/-a/ with no nasality. For instance, note the following example, presented earlier as (4):

(13) mâm nɛ́ɛ̀ wóbʁà.

mâm nɛ́-ɛ̀ wób-g-à

1SG.SUBJ see-AFF elephant-C15-à

‘I see the elephant (that we talked about).’ (AT_20140605)

This leads us to the following questions that will be addressed in this paper:

• What is / are the function(s) of /-a/ on NPs? Is /-a/ a definite marker? How does it relate to the coding of referentiality and identifiability in Mooré?

• What, then, is the function of /-wã/ ~ /ã/ in Ouagadougou Mooré as represented in the speech of the consultant for this work? Is this also a definite marker? Is its function different from what has been claimed in previous descriptions of Mooré?

4 Noun phrase structure

In order to understand NP marking, we must first look briefly at the structure of the Noun Phrase in Mooré. Table 1 gives a selection of noun classes and examples for each class, adopting the traditional Niger-Congo noun class numbering system. The third column provides the citation form of the noun, which is the form given when the speaker is asked

---

For reasons of space, we will not look at pronouns and proper nouns in this paper.
Amos Teo

</table>

To give the Mooré equivalent of an English or French word. For labeling convenience, I use the term citation form to refer to such word forms, before assigning a functional label to them. The fourth column gives the form of each noun with the /-a/ suffix: in all cases, the vowel of the noun class suffix that we see in the citation form is elided. The fifth column gives the form of each noun with the other definite /-wã/ suffix, which is realized as -ã when added to nouns with overt noun class markers in their citation form. Monosyllabic nouns which do not have an overt class marker, e.g. /ñí/ ‘millet’, do not take the suffix /-a/, only the suffix /-wã/.

The vowel in the noun class suffix of a noun in the citation form is typically only produced at the end of a clause / sentence, as in (14) and is elided in other contexts, as in (15) and (16).

(14)  à mú́sá në àli yáá kàrámbíí-sí.
     à=músá në àli yà-à kàrámbíí-si
     3SG.SUBJ=PN and PN COP-AFF student-CL13
     ‘Moussa and Ali are students.’ (AT_2014-02-25_NominalPreds_Existential, Ex.3)

(15)  wób-s rid-d-ã tìt-sè.
     wób-s rid-d-ã tìt-sè
     elephant-CL13 eat-PROG-AFF tree-CL13
     ‘Elephants eat trees.’ (general) (AT_2014-05-21_nasality, Ex.1)

---

⁴ It is unclear what the tone on the final nasalized vowel is in each word. Although the consultant does not consider there to be any difference in pitch between the /-a/ and /-wã/ forms, a phonetic difference in pitch has sometimes been perceived by the researcher: specifically, a slight dip in pitch on the nasalized vowel.
The coding of identifiability in Mooré

3 The coding of identifiability in Mooré

(16) wóbs \( \text{rità} \) tïts \( \text{dàr} \) fâå.
\( \text{wób-s} \ \text{ríd-d-à} \ \text{tï-t-s} \ \text{dà-r} \ \text{fâå} \)
elephant-CL13 eat-PROG-AFF tree-CL13 day-CL5 all

‘Elephants eat trees all the time.’ (general) (AT_2014-05-28)

The syntactic role of the NP does not affect whether the final vowel of the citation form (third column of Table 1) is produced or not: a comparison of (15) with (16) shows that the subject \([\text{wóbs}]\) and the object\(^5\) \([\text{tïts}]\) both do not display the final vowel of their respective noun classes as long as they are not in clause-final position. However, it is possible for the final vowel to be produced in careful speech, or when listing out nouns, as in \([\text{mòòdó}]\) in (16).\(^6\)

(17) mâm \( \text{nëè} \) mòòdó lá tïísé.
mâm \( \text{nëè} \) mòòdó lá tï-sé
1sg.SUBJ see-AFF bush-CL21 and tree-CL13

‘I see bushes and trees.’ (AT_2014-01-13_WomanDonkeyCart_Text Ex.17)

It is important to note that for some noun classes, the noun with the definite /-a/ suffix is homophonous with the noun in its citation form, i.e. nouns from noun classes 1, 2, 6 and 12. However, despite the apparent homophony between some of the nouns in citation form and their /-a/ suffixed forms (fourth column in Table 1), potential ambiguity is only an issue with such nouns in clause-final position, as with \([\text{kàràmbíígå}]\) in (18). In general, it is possible to tell if a noun has the /-a/ suffix if it occurs in non-final position in a clause or sentence: the -a suffix is not elided in words like \([\text{ráwá}]\) in (18) and \([\text{kàràmbíígå}]\) in (19) when in non-final position. Compare these with the elided form \([\text{káràmbííg}]\) in examples (20) and (21).

à=múså ká kàràmbíí-g-å yè
3SG.SUBJ=PN NEG student-CL12-a CFN

‘Moussa is not the student (we talked about).’ (AT_2014-03-11_NominalPredicates, Ex.39)

(20) fò yáå kàràmbííg lå?
fò yá-å kàràmbíí-g lå?
2SG.SUBJ COP-AFF student-CL12 Q

‘Are you a student?’ (AT_2014-02-25_NominalPreds_Existential Ex.11)

\(^5\) Here, I use the term subject to refer to both the subject of a transitive clause and the subject of an intransitive clause, and object to refer to the object of a transitive clause.

\(^6\) It is possible that the final vowel is produced at the end of some kind of intonational unit, as opposed to some kind of syntactic unit.
In general, the /-a/ and /-wã/ forms appear only on the last element of the NP, where they replace the vowel of a class marker suffix. They also do not undergo vowel elision in non-final position in a clause. Deserving special mention are the demonstrative modifiers [kàŋá] 'this' and [kãísá] 'these', which always end in [-a], even in non-clause-final position, as demonstrated by (22)–(24).

(22) nù(g) kàŋá yàà bédrè.
    nù(g) kàn-g-á yà-à béd-rè
    hand DEM-CL12-a COP-AFF big-CL5

    'This hand is big.' (KB_20140224_08_Noun-phrase, Ex.2)

(23) *nù(g) káŋ yàà bédrè.
    ('This hand is big.')

(24) kòr béd-à yiib káísá yàà péëlsè.
    kòr béd-á yiib kâi-s-á yà-à péël-sè
    bag big-a two DEM-CL13-DEF COP-AFF white-CL13

    'These two big bags are white.' (KB_20140224_08_Noun-phrase, Ex.29)

However, in genitive and relator noun constructions, the definite /-a/ suffix is not necessarily the last element in the phrase. For example, in (25), [ròòdá] 'houses'\(^7\) takes the /-a/ suffix, but [kwèlàms] 'doors' does not; while in (26), [filmà] takes the /-a/ suffix.

(25) sú-g ròòdá kwèlàms yáá rààdó.
    sú-g ròò-d-á kwëlàm-s yà-à ràà-dó
    thatch-CL15 house-CL21-a door-CL13 COP-AFF wood-CL21

    'The thatch house doors are (made of) wood.'
    (AT_2014-01-13_Women-carrying-pots-on-head_Text Ex.10-11)

(26) filmà sîŋrè
    film-à sîŋ-rè
    film-a start-CL5

    'Aat the start of the film' (Pear Story, Ln1)

With this background on the structure of Mooré nominals/NPs, we now turn to the discourse-based information structure status of nouns, and how those statuses are coded.

\(^7\) An anonymous reviewer has pointed out that roodo / rooda is not an acceptable plural of 'house', even taking some dialectal differences into account. However, this was the form produced by our consultant, which may reflect differences due to age, geography or the fact that the speaker has been living overseas for a number of years.
5 Indefinite NPs

We first look at the distribution of NPs in citation form: recall that, as seen in (27) and (28), these forms retain the vowel of the noun class suffix when the NP occurs in the final position in a clause or phrase (cf. [tîsê] in (27)), but the final vowel is usually elided when the non-identifiable NP does not appear in final position (cf. [wóbs] and [tîs] in (28)).

(27) wóbs  rîtà  tîsê.
   wób-s  rîd-d-à  tî-sê
   elephant-cl13 eat-prog-aff tree-cl13
   ‘Elephants eat trees.’ (general) (AT_2014-05-21_nasality, Ex.1)

(28) wóbs  rîtà  tîs  dâr  fâà.
   wób-s  rîd-d-à  tî-s  dâ-r  fâà
   elephant-cl13 eat-prog-aff tree-cl13 day-cl5 all
   ‘Elephants eat trees all the time.’ (general) (AT_2014-05-28)

In semi-elicited narrative tasks, where the speaker was asked to describe what he could see in a picture or retell a story based on a video, the first mention of a referent is usually in the citation form of the noun, e.g. [ʃárétè] ‘cart’ and [rààdó] ‘wood’ in (29); [tî bíísì] ‘fruit’ in .

(29) màm  nɛ́ɛ̀  pâá,  bwàŋá,  fârétè  lá  râàdó.
   màm  nɛ́-ɛ̀  pâ-gá  bwàn-gá  fârétè  lá  râ-dó
   1sg.subj see-aff woman-cl1  donkey-cl2 cart and wood-cl21
   ‘I see a woman, a donkey, a cart and wood.’
   (AT_2014-01-13_WomanDonkeyCart_Text Ex.1)

(30) à  yã́kô  tî  bíísì.
   à  yãk-ô  tî  bíi-sì
   3sg.subj pick-prog tree baby-cl13
   ‘He was picking fruit…’ (Pear Story, Ln3-a)

In these examples, the speaker is pointing out to the listener entities that have not yet been previously mentioned in the discourse. As such, these NPs denote referential, but non-identifiable entities. However, once the referents have been established in discourse, and are identifiable by the listener, subsequent mentions of the NP take the -à suffix, as in [ʃárétà] (31) and [tî bíísà] in (32):

(31) á  ká  zô  fârétà  yé.
   á  ká  zô  fârét-à  yé
   3sg.subj neg stand cart-def cf
   ‘She is not on the cart.’ (AT_2014-01-13_WomanDonkeyCart_Text Ex.7)

\* It is not clear why the speaker did not produce the suffix /-a/ ‘aff’ in this example.
In Du Bois (1980)’s terms, it appears that the non-definite NPs are used to activate a “mental file”, while the definite NPs are referring back to these “previously opened files”. Given that the citation forms of nominals are used to refer to entities that the speaker may presume are non-identifiable to the listener at that point in the discourse,\textsuperscript{10} it would be suitable to call these the ‘indefinite’ forms of the nominals. Conversely, we might tentatively treat the /-a/ suffix as a ‘definite’ marker. More evidence of this will be provided in the following section.

We can look at other examples that support an analysis of the citation forms as indefinite NPs. The NPs in (15) and (16), as well as in (33) and (34), denote non-referential and non-identifiable entities, i.e. NPs that do not refer to a particular entity in the world or universe of discourse.\textsuperscript{11}

\end{align*}

\text{elephant-cl12 COP-AFF big-cl5}

‘The elephant is a big animal.’ (Lit. ‘Elephant is big.’) (AT_2014-05-21_nasality, Ex.4)

Another type of construction in which we find the indefinite forms of nouns are as part of predicating expressions that either (a) mark a referent as a member of a particular category, as in (35) and (36); or (b) predicate some property about a referent, as in (37)–(40).

(35) \begin{align*}

In (35) and (36) , [kàràmbúígà] and [kàràmbúí-sì] represent the category of ‘student’. In (37)–(39), words like [tóóbó] ‘bitter’ and [béd-rè] ‘big’ semantically assign a quality to a referent. In (40), [rààdó] designates the material from which the referents are made, and does not refer to particular pieces of wood. Importantly, although these words denoting properties behave formally like nouns, in that they take noun class markers, they cannot take the definite suffix /-a/ in these constructions.12

In summary, indefinite NPs in Mooré are expressed by the citation form of the nominal and are used to refer to non-identifiable entities, i.e. entities that are presumed to be unidentifiable to the listener, as well as to describe properties of subjects in predicate position. In contrast, we shall see that definite NPs take the suffix /-a/, and denote entities that are presumably identifiable to both the speaker and listener.

6 Definite NPs and contrastive focus

As mentioned in the previous section, once a referent has been established in discourse and is presumed by the speaker to be identifiable to the listener, subsequent mentions of

12 However, these non-referential predicates are still sensitive to a formal singular / plural distinction. They agree with the subject for number, as seen in (35) and (36), as well as (38) and (39).
the NP take the definite /-a/ suffix. If we look at the words for ‘bicycle’ (in bold) in the following examples, we can see that the first mention of [wéèfó] in the narrative is in the indefinite, but subsequent occurrences take the definite suffix /-a/. Similarly, the first mention of the ‘rock’ [kúgrì] is in the indefinite, but the next mention takes the definite suffix.

elephant-CL13-DEF eat-AFF tree-CL13-DEF
‘The elephants (the speaker and listener know about) ate the trees (the speaker and listener know about).’ (AT_2014-05-28)

The tones in [wéèfó] are the result of a tone sandhi rule, such that the underlying low tone on the first syllable of /wéèfó/ is realized as falling [wéèfó] when preceded by a word ending in low tone.
The question therefore is if /-a/ is the definite suffix, what about /-wã/ ~ /-ã/, as claimed in previous analyses? In data from elicitation\(^{14}\) it appears that the use of the nasalized suffix is associated with a contrastive focus reading (indicated by underlining in examples). For example, in one reading of (46), the speaker presupposes that the listener believes some other entity to have eaten the trees. The nasalized suffix therefore highlights the argument 'the elephants' to correct this belief. However, even with the nasalized suffix, it is still possible to interpret the sentence without contrastive focus. It simply marked an entity that the speaker presumes is identifiable to the listener. Certainly, more data from naturalistic data would help to clarify this function of the nasalized suffix.

\[(46) \text{wóbsā}\] \text{ri ū tĩsā.} \\
\text{wób-s-ā ū-i tī-s-ā} \\
\text{elephant-CL13-ē eat-AFF tree-CL13-DEF} \\
\text{'The elephants (the speaker and listener know about) ate the trees (the speaker and listener know about)'; or 'The elephants (the speaker and listener know about) (not something else) ate the trees (the speaker and listener know about)' (e.g. it wasn’t the mice that ate the trees). (AT_2014-05-28)}\]

In (47), the nasalized suffix also marks contrastive focus and either has scope over the argument 'the elephant' or over the entire predicate. At present, it is unclear if a reading without focus is available for this sentence and more naturalistic data is certainly needed. Nevertheless, it should still be noted that a contrastive focus reading is not available in (48), where [wóbrã] does not take the nasalized suffix.

\[(47) \text{mām nē ē wóbrā.} \\
\text{mām nē-ē wób-g-ā} \\
\text{1SG.SUBJ see-AFF elephant-CL15-ē} \\

\[(48) \text{mām nē ē wóbrā.} \\
\text{mām nē-ē wób-g-ā} \\
\text{1SG.SUBJ see-AFF elephant-CL15-DEF} \\
\text{'I see the elephant (that the speaker and listener talked about).'} (AT_20140605)\]

In the examples given above, the citation form noun class suffix vowel on the nouns is not /a/, e.g. /wób-gō/ 'elephant-CL15', /wób-sè/ 'elephant-CL13'. In contrast, when the citation form noun class suffix vowel is /a/, e.g. /bóō-gâ/ 'goat-CL12', there is a stronger preference for the speaker to use the nasalized /-ā/ form simply to indicate identifiability; compare (49) and (50). This does not necessarily place any contrast or focus on the argument.

\(^{14}\) Although examples from semi-elicited narratives would be ideal, the analysis of such data is complicated by the presence of a connective nasal morpheme that appears on the final element of clause in running speech with the meaning 'and then'.

\(^{15}\) It is unclear what the tone on this suffix is.
I see the goat’ (that we talked about); or ‘I see the goat’ (as opposed to seeing something else); or ‘I see the goat’ (as opposed to not seeing the goat).

(AT_20140605)

‘I see a goat.’ (AT_20140605)

When asked about (50), the consultant stated that [bʊ́ʊ́ʁá] ‘goat’ in this example could only refer to a goat that has not been mentioned before; however, there is evidence from other examples – both from elicitation such as (51), and from narrative discourse such as (52) – that even such NPs without the nasal marker can be interpreted as being identifiable.

‘Moussa is the student (we know about).’ (nasality preferred)

(AT_2014-03-11_NominalPreds, Ex.34)

‘The woman (mentioned previously) is carrying a child.’

(AT_2014-01-13_WomanDonkeyCart_Text, Ex2)

Importantly, monosyllabic nouns that do not have a noun class marker in citation form (or, which have a zero-form class marker), e.g. /kí/ ‘millet’, can only be marked for identifiability with the nasalized suffix /-wã/ as in (53) (and not with /-a/, /-ã/ or /-wa/). This nasalized form may also give the possibility of a contrastive focus reading.

‘The millet (we know about) is old’; or ‘The millet (not something else) is old.’

(AT_2014-06-04)

For NPs ending in a demonstrative modifier, the nasal /-ã/ suffix occurs on the demonstrative (i.e. on the final element of the NP), where it also marks contrastive focus, as in (54) and (55).
The coding of identifiability in Mooré

(54) wób kánjá yàa bédré.
wób kán-g-á yà-à béd-ré
elephant DEM-CL12-ā COP-AFF big-CL5

(55) nù(g) kánjá yàa bédré.
nù(g) kán-g-á yà-à béd-ré
hand DEM-CL12-ā COP-AFF big-CL5

‘This hand is the one that is big.’ (not something else) (KB_20140224_08_Noun-phrase, Ex.2)

The data raise two interesting points. Firstly, the marking of identifiability on NPs is dependent on the phonological shape of the head, or rather final noun in the phrase, specifically the vowel (if any) in the noun class suffix. The use of nasality may be necessary in some forms to help disambiguate the definite forms from their citation forms, or perhaps when the speaker feels the need to disambiguate the two. Secondly, the formal marking of identifiability in Mooré is intimately linked to what we might call focus. Using Lambrecht (1994)’s terminology, we typically find the nasalized suffixes /-wã/ ~ /-ã/ not just marking identifiability, but also argument focus where the subject or object is being contrasted with another possible referent, and sometimes even predicate focus, where the entire predicate is being contrasted with another one.

This then brings us to the question of whether the nasal feature of /-wã/ ~ /-ã/ can be considered a separate morpheme from /-a/. A preliminary analysis suggests that contrastive focus on indefinite NPs can be marked with a nasal feature (indicated in the second line of the examples just by a tilde) without the vowel /-a/. For example, in (56) and (57), where there is no /a/ to carry the nasalization, the nasal feature is often heard as a nasalized schwa at the end of the NP in (56); or sometimes as a full syllabic nasal consonant that is phonologically bound to the following verb in (57).

(56) wóbsã yá béd-à.
wób-s-~ yá béd-à
elephant-CL13-~ COP big-CL6

‘Elephants are big (in general).’ (e.g. correcting someone who said ‘Mice are big.’) (AT_2014-05-21_nasality, Ex.16)

(57) yûysã ~yûysn dit sáxbó.
yûy-s-~ rid-d16 ság-bó
mouse-CL13-~ eat-PROG dough-CL14

‘Mice eat sagbo (a kind of doughy food).’ (e.g. correcting someone who said, ‘Elephants eat sagbo.’) (AT_2014-05-28)

It is not clear why the consultant did not produce the suffix /-a/’AFF’ in this example. Perhaps this is the case when focus is placed on the argument preceding the verb, and may reflect the historical origin of this construction coming from a cleft construction with a relativized clause.
The presence of nasality without the /a/ vowel (i.e. the [ə] form) in some constructions suggests that /-ã/ could be analyzed as two separate morphemes: /-a/ plus nasalization.

In summary, although /-wã/~/-ã/ are always found on identifiable NPs, the full range of data examined suggests that previous analyses of these suffix forms as the “definite” marker are not entirely accurate, at least for the speech of some Mooré speakers. Rather, the nasalized forms play a role in marking contrastive focus, and for some nouns non-nasalized /-a/ is the indicator of non-contrastive identifiability. Thus, it may be more appropriate to think of the /-a/ on NPs as the definite marker (def), and the nasal /-ã/ as a focus marker (foc) that gives the potential for some sort of contrastive focus reading. These forms represent two separate structural categories that map onto different semantic and pragmatic functions depending on the construction and the context.

7 Complications to the analysis of identifiability and focus

This study of identifiability marking of NPs is still preliminary, as more texts need to be collected and analyzed. One complication here, however, is that some non-final clauses in a chain in Mooré are marked with a nasal connective morpheme. It is therefore not always possible to tell if the nasality on [bʊ́ʊ́ʁã] in the first line of (59) marks definiteness and focus on the NP, or if it marks non-finality of the clause, or both.

(59) rāwá ták bṑ̃kà pīòk tībkà sḕèkà.
rāw-ā ták bṓ-g-ã pīòg-ã tīi-g-ã sē̃-gã
man DEF pull-PROG goat-CL12 pass-AFF tree-CL12-DEF side-CL12
‘The man pulled the goat, passed by the tree and left.’ (Pear Story, Ln20)

There are also examples from texts where the indefinite form of a noun is used to refer to an entity that has already been established in discourse. For example, in a story about a Rabbit and Hyena who go off in search of honey, we find in the second-to-the-last line the form [à sɪ́ɪ̀dò] ‘his honey’, as shown in (60). In most of the preceding text, the honey has been referred to in the definite form [sɪ́ɪ̀dà]. Perhaps the overt definite marker is not necessary with possessed NPs, but this is something that needs to be checked.

(60) ... n dík à sǐ́dò.
... n=dík=à sǐ̃dò
CONN=take=3SG honey-CL21
‘... and took his honey.’ (DP_Rabbit & Hyena August 2013, Ln.20)

17 In relator noun constructions, the relator noun comes after the head noun, but it is the head noun that takes the definite suffix /-a/.
Furthermore, the analysis has only looked at the coding of identifiability on NPs with common nouns as heads. Other kinds of NPs have been ignored, including NPs headed by borrowed nouns and NPs that refer to unique entities (entities that are referential and presumably identifiable to the listener). For example, \[\text{prezidɔ̃} \] ‘the president (of Burkina Faso)’ in (61), is not formally coded with the definite suffix. The addition of the nasal -wā, as in (62), necessarily leads to a contrastive focus interpretation of the argument.

(61) prezidɔ̃ wād-dā=mè.
    prezidɔ̃ wād-dā=mè
    president come-AFF=CF

’The President (of Burkina Faso) is coming.’ (assuming one is in Burkina Faso, so it is clear which president you are talking about) (AT_2014-06-04)

(62) prezidɔ̃-wā wātāmè.
    prezidɔ̃-wā wād-dā=mè
    president-FOC come-AFF=CF

’The President is coming’ (not anyone else). (AT_2014-06-04)

As a final point, it should be mentioned that in addition to morphological marking, arguments in Mooré can be brought into focus by syntactic means. For example, word order can be manipulated to bring an argument to the front of a clause, as in (63).

(63) kārāmbiígà yáá mááam.
    kārāmbīí-g-à yā-à mááam
    student-CL12-DEF cop-AFF 1SG.O

’The student (that we were talking about) is me.’ (AT_2014-03-04_NominalPreds, Ex.15)

In addition, there is a construction containing the copula \( la \), which marks the subject for greater emphasis: [ SUBJECT la PREDICATE ]. This is illustrated in (64) and (65). This is a more structurally marked construction, especially in (64) where the object form of the pronoun appears preverbally, as one would normally expect it to appear post-verbally. In (65), the alternate kārāmbīgā is preferred, though the form without the final nasalization is also possible.

(64) mááam lá kārāmbīgā.
    mááam lá kārāmbūí-g-à
    1SG.O COP student-CL12-DEF

’I am the (one) student’ (not anyone else). (AT_2014-03-04_NominalPreds, Ex.16)

    3SG.SUBJ=PN COP student-CL12-DEF student-CL12-DEF-FOC

’Moussa is the (one) student’ (not anyone else). (AT_2014-03-11_NominalPreds, Ex.31)
8 Summary and further research

It is hoped that this new analysis of /-a/ as a definite marker in Mooré will serve as a useful update to previous analyses (e.g. Peterson 1971; Canu 1974) that have only considered the nasal forms /-wã/ ~ /-ã/. The paper has also argued that /-ã/ could be treated as bimorphemic, with the nasal element marking (potentially contrastive) focus. However, it is more difficult to morphologically analyze /-wã/, which is used with monosyllabic nouns like /kí/ ‘millet’. Most importantly, it has shown that the three forms /-a/, /-ã/ and /-wã/ may share similar semantic/pragmatic functions of coding identifiability, but this depends on the underlying phonological form of the noun class suffix.

The link between identifiability and the marking of contrastive focus is particularly interesting, though perhaps not too surprising given that the marking of definiteness is also associated with speaker and listener attention. In Dagbani, a related Gur language, Olawsky (1999: 40) reports two “definite articles”: la and maa, with the latter described as a “strong” article that adds “more emphasis” than the former. In general, the languages of West Africa look like a fertile place to examine the interaction between morphosyntax and information structure. Previous studies of these languages include Fiedler & Schwarz (2005) that looks at the “non-focal” part of sentences in five Kwa and Gur languages, as well as Schwarz (2010) on argument and predicate focus in four Gur languages; neither of these include data on Mooré.

Future studies could also investigate how syntactic focus-marking strategies interact with the use of the nasal focus morpheme. For instance, Kabore (1985: 445-450) looks at a number of constructions that pertain to the marking of contrast and emphasis, including what he writes as a construction that uses /sǐ/ which seems to corresponds to a /hə̃/ subordinator/relativizer in the data collected here. Indeed, further studies of identifiability and focus in Mooré will need to consider relativization strategies.

The study of information structure calls for a move away from elicited data and demands much more work in the analysis of texts collected from a wide range of speakers across different genres. More importantly, it suggests the need for greater experimental work that considers the role of speaker and listener attention and which provides ways of describing cognitive categories independent of the linguistic correlates that linguists traditionally use as evidence for such cognitive categories. It would seem that we are just barely beginning to scratch the surface when it comes to understanding the notions of referentiality, identifiability and contrastive focus and how they might be coded by linguistic expressions.
